HIGH TEMPERATURE SUBMERSIBLE HT MOTORS

Dynapumps Offices Australia & Chile

Dynapumps

MORE THAN JUST PUMPS

HIGH TEMPERATURE SUBMERSIBLE MOTORS | 50/60Hz

CATALOGUE

General Features

- High quality PE2+PA winding wires
- High efficiency provides operation cost savings
- Water coolant system
- Flange with NEMA standards
- Stainless steel shaft
- Optional high corrosion resistive materials (AISI 304 - AISI 316 - Duplex - Bronze)
- Maximum ambient water temperature 50°C (70°C is optional)
- Standard voltage 380/460V - 50/60Hz (Allowable voltage tolerance ±%10.)
- Variable operation revolutions by frequency convertor (over 30Hz)
- Availability to be operated by Soft-Starter
- CW & CCW direction of rotation.
- Rewindable Dynapumps Motors provides long service life.
- Our motors can be operated horizontally in pools and wells which are not deep enough

Heavy duty bearings with high thrust capacity

Heavy duty bearings provides the option to revolve both sides, has the capacity to carry high thrust load.

Water lubricated radial carbon bearings

Radial carbon bearings, which have channels in its structure that makes it possible to get lubricated by water easily, provides precise bearing of rotor shaft at up and down.

Chrome-plated bearing collet

Chrome-plated and precisely machined bearing collets which are located in the radial bearings operating area, have great importance for bearing the rotor.

Mechanical sealing system for high sand resistance and degree of protection: IP68

Although mechanical seal is optionally used by other companies, it is always used by Dynapumps as a standard, to prevent sand and other particles to get into motors to provide long bearing life.

Practical and easy-to-mount output power cable

Connection of the power cable to body is made practically by cable seal and seal cover. Power cables can be changed easily without any damage.

Pressure balancing checkvalve

Pressure balancing checkvalve controls the pressure changes inside the motor. When the pressure increases, it throw water out of the motor. When the pressure drops, it filtrates the water inside well and gets it inside the motor by the help of this checkvalve to balance the pressure inside. Thus why pressure differences inside motor never causes membrane under motor to blow up.

PT100 Overheating protection

By connecting the PT100 thermal sensors to the slot that is standardly placed on upper bearing body, motor temperature can be easily measured.

Up-Thrust ring

Provides safe operation conditions for motor by absorbing Up-Thrust loads with it's machined surface and water channels on it.

Cable connection

Preventing the water inside the motor to run through the cable and reach connection parts of power cables by specially designed cable seals.

Adjustment screw

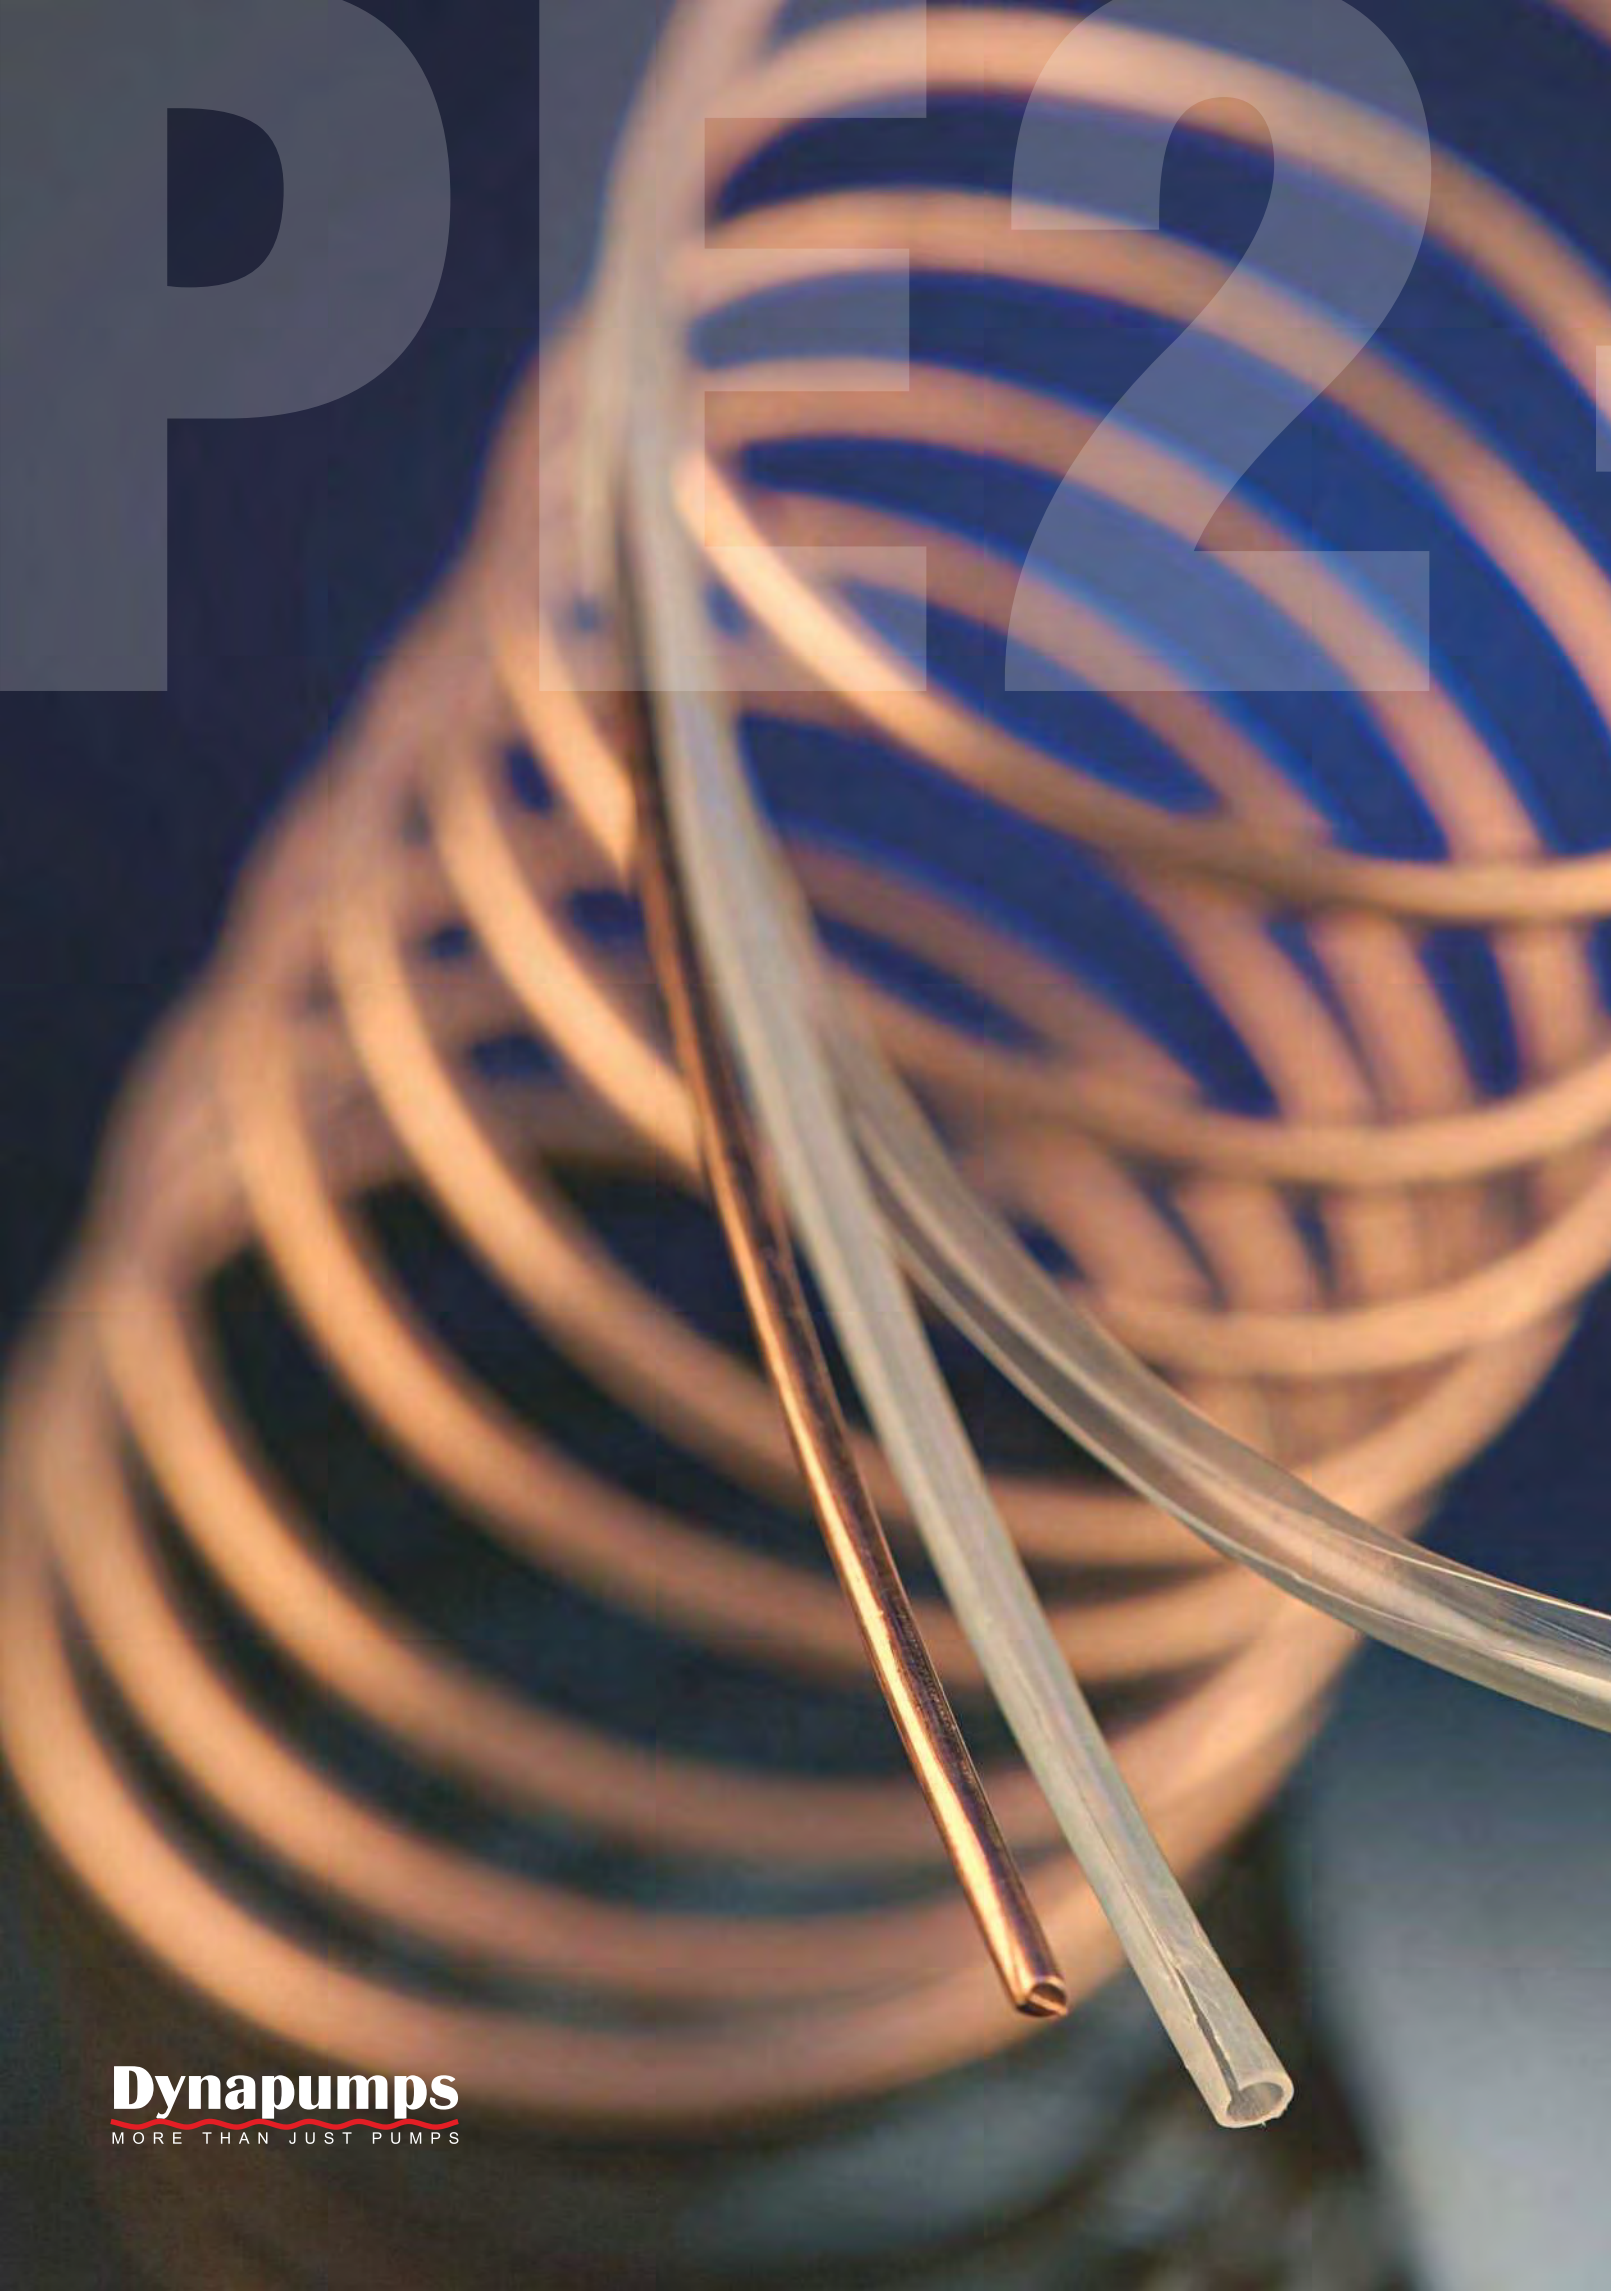
Standard shaft height can be precisely adjusted by the adjustment screw on the thrust bearing base.

Membrane

Membrane minimizes the expansion pressure that is caused by heating of cooling water's inside the motor.

Slinger (sand guard)

Slinger helps to prevent the sand inside the water of the well entering in mechanical seal and through mechanical seal to inside of the motor.



PE-2
Dynapumps
MORE THAN JUST PUMPS

A standard of HT Motors:

"PE2+PA Winding Wire"

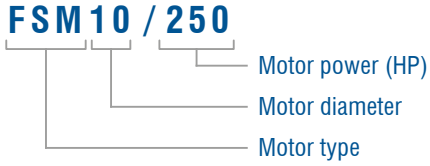
- ✓ *Perfect performance up to 50°C ambient temp.,*
- ✓ *Longer Life*
- ✓ *High resistance against voltage fluctuation,*
- ✓ *Gives more safety factor then standard motors*

Dynapumps submersible motors get their power from the PE2+PA winding wire used as standard. This wire, consisting of a single copper conductor, has a very high insulation resistance. PE2 (Polyethylene) provides electrical isolation, PA (Polyamide) provides mechanical protection. Increased heat resistance is achieved by cross-linking of polyethylene. In this way, Dynapumps submersible motors offers superior performance at high voltage and temperatures up to 50°C. At the same time it ensures trouble-free operation and a long service life of the motors for many years.

Technical Data

Tensile Strength	Standard: IEC 60811-1-1	23°C (±5)	≥ 10 N/mm²
Elongation	Standard: IEC 60811-1-1	23°C (±5)	≥ 100 %
Dielectric constant	Standard: DIN 53483	20°C / 800 Hz	2,3
Specific insulation resistance	Standard: IEC 60093	20°C	10 Ω cm
Dielectric breakdown strength	Standard: DIN VDE 0303-21	20°C/50 Hz	70 kV/mm
Tensile strength after aging		80°C / 7x24 saat	≥ 10 N/mm²
Elongation at break after aging		80°C / 7x24 saat	≥ 100 %

Product Code System



Part List

No	Part Name	Material
1	Stator	-
1.1	Winding wire	PE2 / PA
1.2	Stator package	M350 / *Magnetic Seal*
1.3	Stator shell	AISI 304
2	Rotor	-
2.1	Shaft sleeve	St 37 (Coated CrNi)
2.2	Balance ring	St 37
2.3	Copper ring	Cu
3	Radial bearing	Carbon
4	Upper bearing body	GG20-22
5	Bushing	Bronze
6	Slinger (sand guard)	NBR_EPDM
7	Hexagon socket cap screws	Inox
8	Copper ring	Cu
9	Cover seal	AISI 420
10	Mechanical seal	Seramic Carbon
11	Axial thrust bearing key	AISI 420
12	Axial thrust bearing	Carbon With Antimony
13	Retaining ring	St 37
14	Tie rod	Inox
15	Lower bearing body	GG20-22
16	Thrust bearing support	GG20-22
17	Ball holder	St 37 (Coated Cr+3)
18	Thrust bearing ball	Inox
19	Tilting pads	AISI 420
20	O-ring	NBR 70
21	Thrust bearing body	GG20
22	Copper ring	Cu
23	Nut	Inox
24	Screw (thrust bearing base)	Inox
25	Membrane	NBR-EPDM
26	Membrane body	GG22
27	Hexagon socket cap screws	Inox
28	Check-valve	Bronze
29	O-ring	NBR 70
30	Cable seal	NBR
31	Seal cover	AISI 304
32	Nut	Inox
33	Plush (r 3/8")	Bronze
34	Ball holder pins	Inox

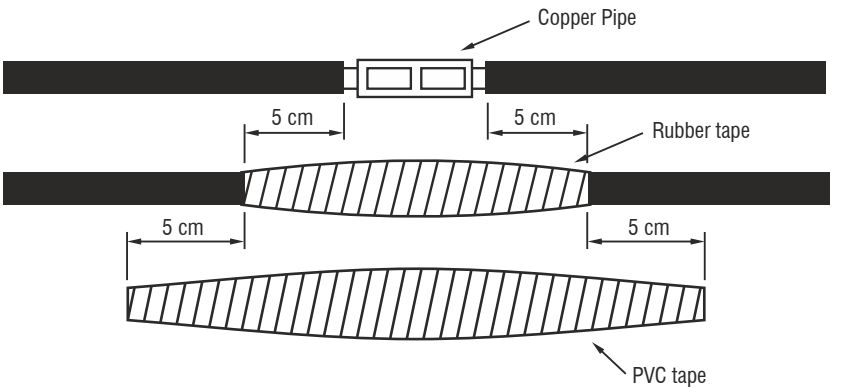
Other Features



Power Cable Connection

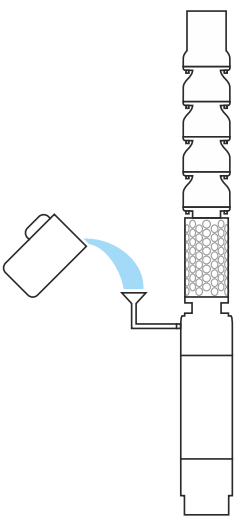
Connection of the power cable that will be used along the well and until the control panel with the power cable on the motor must be done very carefully and by the professionals only. Unless the insulation after the connection is well done, short circuit might happen when the connection area is in the water.

Insulation of each cable should be stripped only as far as necessary to provide room for a stake type connector. Each individual joint should be taped with pvc tape, using two layers by wrapping tightly for eliminating airspaces as much as possible.

Total thickness of tape should be no less than the thickness of the cable insulation in order to prevent the smashing of the cables when the pump is lowered in the well.

Motor Water Filling

During the storage and delivery period, antifreeze is used not to cause any freezing. Dynapumps submersible motors are filled with water+antifreeze mix before shipment to protect motor till -10ºC freezing temperature.



Before the installation of the motor to the well, water level inside the motor should be checked. Position the motor horizontally and remove the screw 1 and 2, fill the motor with clean water if it is not full. After waiting 30 minutes with the filling screw open, fill the water completely again and thight the screw providing no leakage.

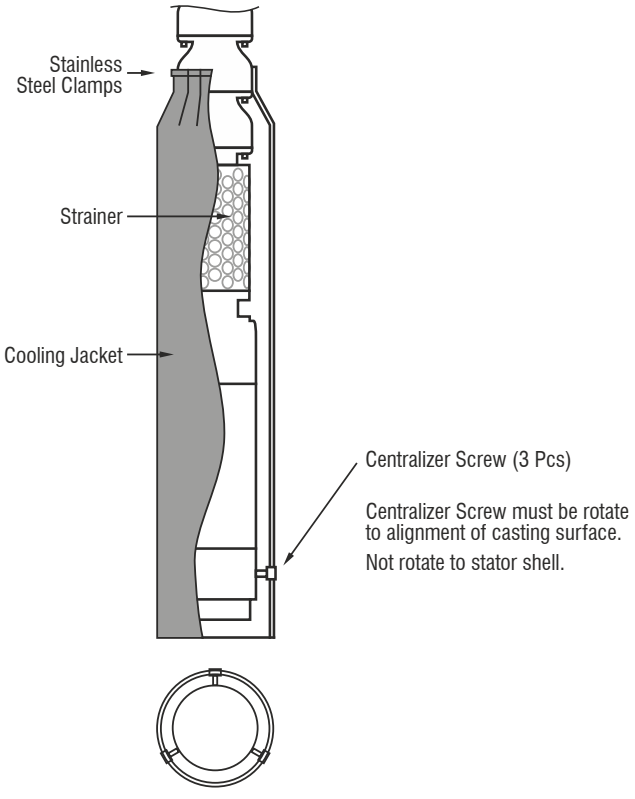
Dynapumps
MORE THAN JUST PUMPS

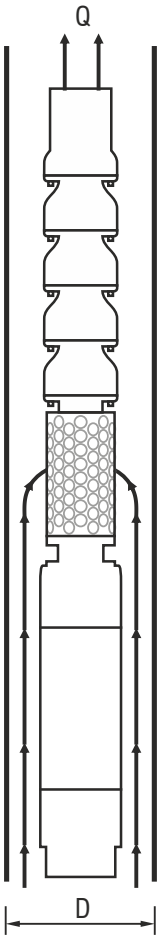
Use Cooling Jacket

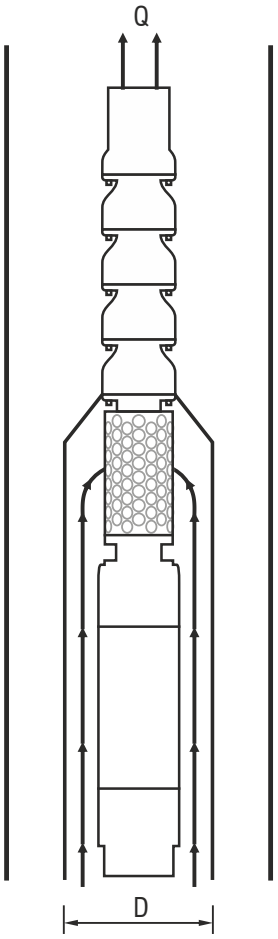
Cooling of submersible motors is provided with the flow of the water around it. That's allows water flow around motors has vital importance during submersible pump installation.
This flow rate depends on diameter and power of motor.

Most important factor of submersible motors' long service life is that the motor has to be cooled well. Required flow velocity around the motor is given in the table below for motors being cooled well enough.

If the motor will be installed in an open body of water (i.e pool) or diameter of the well is much bigger than the diameter of the motor, Flow Inducer Sleeve must be used to provide the flow velocities that are given in the table below, around the motor.







Motor Type	Motor Rating	Min. Water Flow(m/s)
6"	5.5 - 18.5 kW 22 - 37 kW	0.2 0.5
7"	22 - 55 kW	0.2
8"	30 - 55 kW 60 - 92 kW	0.2 0.5
10"	81 - 110 kW	0.5

Other Features

Insulation Resistance Test

All Dynapumps motors are applied insulation test under 3.000 V before shipment. Motors which have at least 2.000 megaohm test result are shipped. Insulation test results should be controlled before the installation and after connecting power cables as it is explanied below. Meger tester's one probe should be touched to motor body and other probe should be touched to tip of each power cable to measure the insulation of each phase.

If there is any short circuit in a phase, insulation value is 0 megaohm.

Under the normal operating conditions, a motor inside the well should have 2 megaohm insulation resistance. When the insulation resistance drops under 0.5 megaohm, there might be a insulation problem in winding.
Test voltage should be at least 500 V DC.

After extending power cables with a joint, same test procedures should be also appllied for insulation control while power cables are inside water. If insulation test result for any winding is lower than 100 megaohm, cable joint should be done again.

Dynapumps
MORE THAN JUST PUMPS

Use Frequency Convertor and Soft Starter

These points listed below should be taken into consideration while operating submersible motors with frequency convertor and soft starter.

- Needed precautions should have been taken to protect your frequency convertor from voltage flactuations.
- Flow rate around motor must be at least 0,15 m/s. If flow rate is not enough, flow inducer sleeve must be used to provide the needed flow rate.
- In systems which are operated by frequency convertor and soft starter, motor selection should be done as choosing next higher motor rate for pumps will provide long service life for motors.
- Motors should be operated between 30-50 Hz with frequency convertors. As the protective water layer can't be formed on thrust bearing at the lower frequencies, motor would get damaged.
- Dual slope frequency convertors should be used while using soft starter too.

Voltage Drop and Cable Power Loss

To determine the cable section it should be considered that the voltage drop must not exceed 3%.
The formulas used for voltage drop calculation are given below.

Direct starter

1 cable	$U_V = \frac{3{,}1 \times L \times I \times \cos\varphi}{q \times U}$	$q = \frac{3{,}1 \times L \times I \times \cos\varphi}{U_V\% \times U}$
2 cables in parallel	$U_V = \frac{1{,}55 \times L \times I \times \cos\varphi}{q \times U}$	$q = \frac{1{,}55 \times L \times I \times \cos\varphi}{U_V\% \times U}$

Star-delta starter

$U_V = \frac{2{,}1 \times L \times I \times \cos\varphi}{q \times U}$	$q = \frac{2{,}1 \times L \times I \times \cos\varphi}{U_V\% \times U}$

The power loss along the feeling cable has to be calculated adjacent to

$$P_V = \frac{U_V}{\cos^2\varphi}$$

L : *Cable length (m)*
I : *Current at nominal voltage (A)*
q : *Condutor section (mm2)*
cosφ : *Power factor*
Pv : *Power loss (%)*
Uv : *Voltage drop (%)*
U : *Nominal voltage (V)*

Dynapumps
MORE THAN JUST PUMPS

Trouble Shooting

Motor Does Not Start

Possible Cause	Remedy
No power or incorrect voltage	Check voltage at lines. Contact power company if voltage is incorrect
Fuses blown or circuit breakers tripped	Replace with proper fuse or resetcircuit breakers
Control box malfunction	Repair or replace
Defective wiring	Correct faulty wiring or connections
Bound pump	Pull pump and correct problem. Run new installation until the water cleans
Defective cable or motor	Repair or replace

Motor Starts Too Often

Possible Cause	Remedy
Check valve stuck open	Replace if defective
Waterlogged tank	Repair or replace
Lenk in system	Replace damaged pipes or repair leaks

Motor Runs Continuously

Possible Cause	Remedy
Low water level in well	Throttle pump outlet or reset pump to lower level. Do not lower if sand may clog pump
Worn pump	Pull pump and replace worn parts
Loose coupling or broken motor shaft	Replace worn or damaged parts
Pump screen blocked	Clean screen and rest pump depth
Check valve stuck closed	Replace if defective
Control box malfunction	Repair or replace

Motor Runs But Overload Protector Trips

Possible Cause	Remedy
Incorrect voltage	Contact power company if voltage is incorrect
Overheated protectors	Shade box, provide ventilation or move box away from source
Defective control box	Repair or replace
Defective motor or cable	Repair or replace
Worn pump or motor	Replace pump and/or motor
